In Sky, six big steps forward from now to 2070 . . .

Carbon pricing

Energy efficiency

Electrification of
final energy

Growing new
energy systems

Carbon capture
and storage

Ending deforestation

. . . underpinned by a changing consumer mind-set and societal license for change.

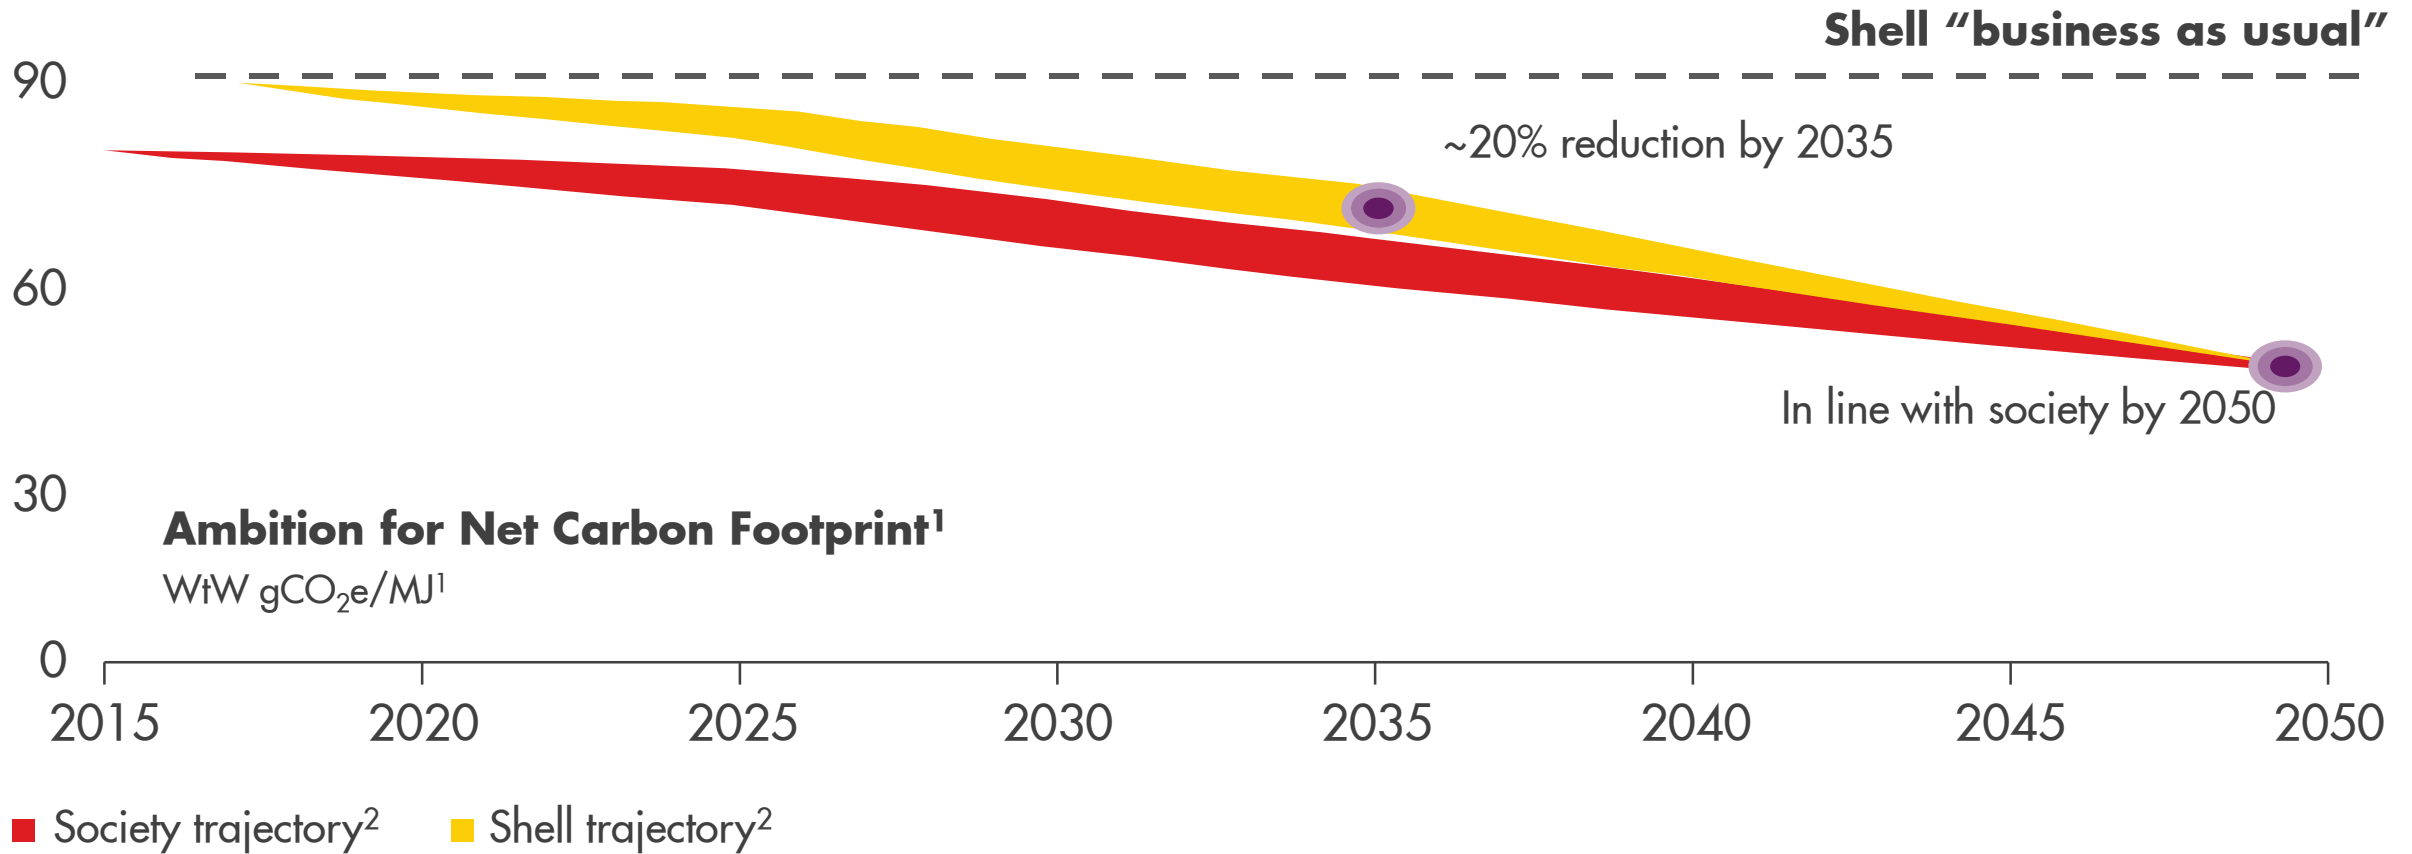

Shell's role in the energy transition

- Grow our natural gas business
- Build a profitable new energies business
- Research and develop innovative low-carbon energy solutions
- Improve the CO₂-efficiency of our own operations

Energie-challenge

Reduction CO₂-emissions is essential

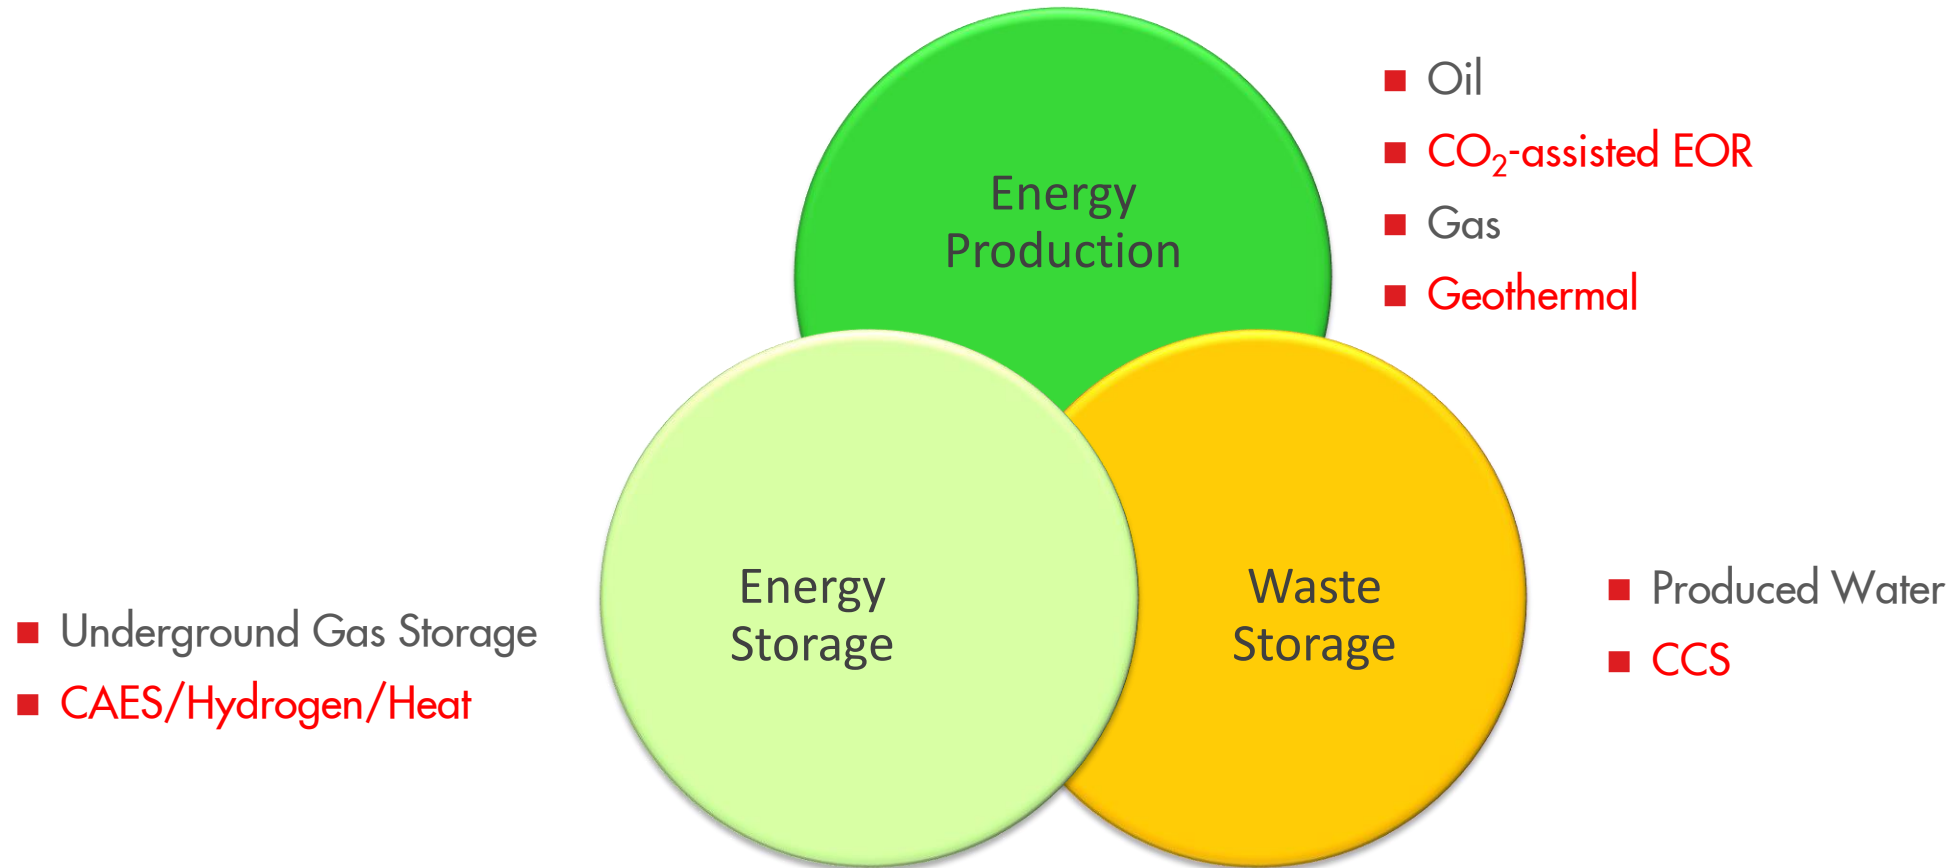

¹ Net Carbon Footprint measured on an aggregate "well to wheel" or "well to wire" basis, from production through to consumption, on grams of CO₂ equivalent per megajoule of energy products consumed; chemicals + lubricants products are excluded. Carbon Footprint of the energy system is modelled using Shell methodology aggregating lifecycle emissions of energy products on a fossil-equivalence basis. The methodology will be further reviewed and validated in collaboration with external experts.

² Potential society trajectory includes analysis from Shell scenarios estimate of Net Zero Emissions by 2070 and IEA Energy Technology Perspectives 2017; Potential illustrative Shell trajectory.
